

Exam Behaviour Analysis – Insights & Findings

Executive Summary

This analysis was conducted on event-level examination logs containing over 8 million interactions from approximately 88,000 candidates. The objective was to understand candidate engagement, behavioral patterns, language preferences, and activity trends during the examination.

Key Findings

1. Candidate Participation

More than 88,000 candidates participated in the examination, generating over 8 million event records.

2. Auto Save Dominates Event Logs

Auto Save events accounted for approximately 90.73% of all recorded events.

Implication: The majority of logs are system-generated rather than candidate-generated. Behavioral analysis should therefore focus primarily on review-related and interaction-based activities.

3. High Candidate Engagement

Approximately 96.56% of candidates belonged to the Heavy Engagement segment.

Implication: Most candidates remained actively engaged throughout the examination process.

4. Review Behaviour

Mark for Review & Next actions were significantly higher than Unmark for Review actions.

Implication: Candidates frequently flagged questions for later review, indicating active decision-making during the exam.

5. Language Preference

English accounted for approximately 75.63% of interactions, while Hindi accounted for approximately 24.37%.

Implication: English remains the dominant examination language among participants.

6. Response Selection Pattern

Option A was the most frequently selected response option, while Option D was selected least frequently.

Implication: Response distribution was not uniform across available answer choices.

7. Hourly Activity Trend

Candidate activity peaked around 16:00 hours and declined sharply after 17:00 hours.

Implication: Most candidate interactions occurred during the middle phase of the examination window.

Recommendations

Recommendation 1

Exclude Auto Save events from future behavioral studies to better understand actual candidate actions.

Recommendation 2

Focus on Mark for Review activities to gain deeper insights into candidate decision-making behavior.

Recommendation 3

Monitor infrastructure performance during peak activity periods, especially around 16:00 hours.

Recommendation 4

Conduct deeper analysis on section-wise engagement to identify difficult or highly interactive sections.

Conclusion

The analysis indicates strong candidate engagement, a clear preference for English-language questions, and substantial system-generated logging activity. Peak interaction periods and review behavior patterns provide useful insights for improving future examination monitoring and candidate experience analysis.
